Determine the presence of various bacterial species, including Proteus mirabilis, Morganella morganii, and P. stuartii, all thought to be included in Bergey's Manual of Systematic Bacteriology.

Achromobacter insolitus (Sn1), Morganella morganii (Sn2), and Klebsiella are among the organisms considered.

Morganella morganii and Hafnia alvei were mentioned in Bergey's Manual of Determinative Bacteriology, 8th ed. Morganella morganii and Hafnia alvei were also discussed.

Proteus, Staphylococcus, Streptobacillus, Aeromonas, and Morganella were first observed in the mid-gut of laboratory-reared B. morganellci morganii. Serratio: Bergey's Manual. ABSTRACT A new method for classifying bacteria is presented and applied to a large set of biochemical data for the Enterobacteriaceae. The method minimizes.
